

Installing packages

- Initially I started off installing each package one by one. I was successful for pytorch 1.9.1, absl-py 0.10, captum 0.3.0, and pyyaml 5.3.1.
- I started coming across syntax errors when trying to install entmax 1.0 that I couldn't seem to figure out. I deleted the entmax cells because it was getting confusing and I instead imported entmax and printed the version. it returned 1.3 so it turns out it did install at some point. The same happened for scipy -I got multiple errors but received the output 1.17.1 when printing the version. (I'm assuming I ran into these errors because the versions I had installed were just different versions -so 1.3 instead of 1.0 for entmax and 1.17.1 for scipy instead of 1.5.2.
- I upgraded scipy and got it to 1.18 but then got stuck at 1.18. I tried uninstalling then reinstalling 1.5.2 but still got an error so I just reinstalled 1.18.
- I imported einops and printed the version and successfully got back 0.8.2.
- I went back to trying to upgrade scipy to version 1.5.2 but couldn't so I checked what version of python I had and got back 3.13.14 so I'm guessing scipy 1.5.2 isn't compatible with this version.
- All packages were installed successfully and all are up to date except scipy so I'll keep that in mind if I encounter any errors with scipy in the future.

Memory wrapping

- Replaced last layer
- Modified forward function -removed call to self.linear
- Created new forward function
- Created class -'MemoryWrapMobileNetV2'
- Indentation error x2 -solved
- Near the end I kept having to restart the kernel and rerun all cells because I repeatedly got errors that torchvision or torch were not found even though they were imported in the cells prior.
- My Jupyter crashed over 20 times so I switched to collab and then it ran smoothly.
